

Bloktherm Thermo Plus

Single-component thermal insulating paint, surface coating based on acrylic-vinyl binder for challenging and demanding conditions. The vinyl coating has better mechanical properties than alkyd coatings, higher hardness, and resistance to mechanical impacts. It allows direct application to stainless steel, galvanized surfaces, plastic, glass, concrete, however, due to varying material quality, we recommend prior adhesion testing. It can also be applied to the Bloktherm system. Before applying the paint, we recommend priming the surface.
